Fluoride is Not Safe for a Baby!

There is now complete scientific agreement that, contrary to what we were told, swallowing fluoride does not play any significant role in reducing tooth decay.

Fluoride's only measurable effects on dental decay are from topical application, as in toothpaste which is readily available to all. But read the FDA warning on fluoridated toothpaste. The FDA has never approved any ingested fluoride for safety and effectiveness.

Ingested fluoride causes dental fluorosis: white opaque spots, brown stains, mottled and fracture prone enamel.

Exposure to fluoride at levels well below the concentrations in tap water cause thyroid and other endocrine impairment, and is not safe for infants, toddlers, and children under 6 to drink in uncontrolled amounts.

The test: Not one manufacturer of the fluoridation chemical used will state that their product is safe for ingestion or will reduce tooth decay. Require that your water provider deliver a statement direct from the manufacturer, not an endorsement.

U.S. EPA states they cannot produce one single chronic toxicological study on the actual chemical (hydrofluosilicic acid) used. Demand that your water supplier deliver a single toxicological study on the long-term effects of their exact substance, hydrofluosilicic acid, not a review. Demand that your water supplier deliver the proof, not the grandiose claims and old rhetoric.
